Acceptance Testing

User Story 1 Score: 3

As a new user I want to open an account with the Planetarium so I can save my celestial findings

For creating an account I would say that the application is relatively intuitive to use. The link to get to the register page is a little small, but it is available and easy to access. When creating an account where to put the username and password is obvious but, the actual requirements for a username and password isn't shown anywhere, so it is a lot of guessing and checking until a valid username and password is found. Other than not understanding the requirements the rest of the service is easy to use. The service itself does not inspire great confidence. A pure black background with just text is barely a step up from just html on a page. No real indication of what the service is other than Planetarium login on the initial page otherwise just blank. Nothing really stands out not necessarily pleasing or unpleasing just boring and empty.

User Story 2 Score: 3

As a user I want to securely access my account so I can interact with the Planetarium in a secure environment

For securely accessing an account where to put in the username and password is very obvious and with proper account information logging in is simple. The password is hidden while typing it in so that helps make it more secure, it could be easier if there was a button to show the hidden password when typing it in to double check, but it is unnecessary. Again the service definitely doesn't inspire pure confidence nor is it extremely pretty.

User Story 3 Score: 2

As a user I want to see my planets and moons added to the Planetarium so I can track my findings

Once logged in all the planets and moons are readily available it is a little confusing to keep track of which moons relate to which planet, possibly making them children of the planets instead of separate rows or just making the rows of moons next to the planet before another planet is shown could make it more intuitive. This part of the service doesn't really have execution so the ease of use is simple. The service isn't super pleasing to look at its pretty much just a table with a couple fields to add more data.

User Story 4 Score: 2

As a user I want to add new planets and moons to the Planetarium so I can update my findings

When adding moons and planets it doesn't quite give exact requirements on what can be added, but overall its a simple form to be submitted so the use of the service is relatively intuitive. The service is simple and easy to use as long as the planet added doesn't already exist or the name is valid the service works correctly and adds moons and planets correctly. Looking at the service it doesn't inspire confidence especially when adding planets and moons without pictures, because the row added is very small and hard to really read. The service is also not pleasing to look at as its just a table with fields to add data with no real decorations or styling on the page.

User Story 5 Score: 3

As a user I want to remove planets and moons from the Planetarium so I can correct my findings

When deleting the moons its pretty simple and intuitive, all you have to do is enter the celestial body to delete and then if its a planet all the corresponding moons are deleted as well. The service still does not inspire confidence as with the previous user stories it is all on the same page, but at the very least no obvious defects were found when deleting rows. The service is also not pleasing to look at as the page isn't styled well.
